

Overview of Programming Languages (I)

History of Programming Languages

- Earliest digital computers **without memory** (The imitation Game Clip “Turing’s Machine” 2014 <https://www.youtube.com/watch?v=nmXzPgVjxRw>)
 - adjust gears, connect cables and flip switches
- Later computers **with punch card reader** (Punch Card from a Fortran program https://en.wikipedia.org/wiki/Computer_programming_in_the_punched_card_era)
 - punch card: card-stock piece of paper with holes punched in it
 - data and instructions are holes
 - card reader reads holes
 - programmers **had to know the machine code** (different machines have different instructions)
 - *not easy to read and write*
- **Assembly language**
 - **machine-dependent**, CISC, RISC, close related to the machine architecture
 - the first abstraction of machine code, using text mnemonics to represent binary instructions and symbols to represent binary sequence
 - *punch card reader became interpreters*
 - more readable than pure machine code
 - **inefficient and error-prone** (no efficient flow control but JMP to lines)

- After 1950s
 - PL were intended to **bridge the gap** between natural language and the machine instructions
 - **Higher-ordered languages (our focus in CS333)**
 - Independent of any particular machine architecture
 - Closer to natural language
 - *Compilers/interpreters* translate the programs into assembly languages/machine code
